PROJECT TITLE	
SWA-ASTHA	
PROJECT ABSTRACT	
The rapid digital transformation in healthcare has improved accessibility but continues to suffer from fragmented data, isolated hospital systems, and limited patient control over medical information. Patients frequently struggle to manage prescriptions, lab reports, bills, and insurance documents spread across multiple hospitals and service providers. Similarly, pharmacies and insurers face challenges in verifying prescriptions and validating claim documents due to disconnected systems. To address these gaps, this project proposes a unified digital healthcare ecosystem—Swa-Astha: Smart Patient Data Sharing System—built on the MERN stack and designed to integrate hospitals, pharmacies, and insurance providers through a single platform. The system introduces a centralized Electronic Health Record (EHR) that consolidates medical reports, prescriptions, bills, and insurance claim data under one universal patient ID. It enables hospitals to upload clinical documents securely, pharmacies to access digitally verified prescriptions, and insurance companies to review claim-related evidence in real time. A strong consent-driven access model, along with encryption, role-based authentication, secure cloud storage, and standardized data formats (HL7/FHIR), ensures privacy, interoperability, and compliance with healthcare data policies. The mobile and web application is designed to be user-friendly, allowing patients to upload, scan, view, and share documents effortlessly. Features such as medication tracking, expense summaries, emergency access, and real-time notification updates further enhance usability. Comparative analysis with existing systems like Practo, Tata 1mg, Apollo 24/7, and MyChart highlights their limitations in multi-hospital data fusion, pharmacy integration, and insurance management—gaps that Swa-Astha effectively fills. Overall, the system provides a comprehensive, secure, and interoperable digital health platform that connects all major healthcare stakeholders. By enabling transparent information exchange, reducing redundancy, preventing prescription fraud, and simplifying insurance workflows, Swa-Astha significantly enhances healthcare efficiency and empowers patients with full control over their medical data. The project demonstrates strong potential for real-world implementation as a next generation integrated digital health ecosystem.	
Project Outcome	Swa-Astha enables a single, consent-driven digital health record that securely connects hospitals, pharmacies, and insurers, giving patients complete control over their medical data while streamlining verification and claims processes.
